CROP PROTECTION AFRICA
INTRODUCTION

GreenLife Crop Protection Africa Ltd (GCPAL) is a leading agrochemical and public health company in Kenya. Its focus is on provision of quality and affordable wide range of crop protection, pest control products and general agricultural and public health consultancy. GreenLife is strategically positioned and adequately endowed to serve all the public health domains across the country giving each customer specialized advisory consultancy and tailor made products to meet their specific pest control needs.

WHY GREENLIFE?

At GreenLife, we refer to our stakeholders as associates; we hold our employees, customers, suppliers and other stakeholders with high esteem. We believe our success is derived from the success of our stakeholders. As GreenLife community, we believe in delivering what is promised. Quality and timeliness is guaranteed.

✶ Vision - To be the model and reference company for quality agrochemicals, seeds, farm equipments, public health and nutrition products in Africa

✶ Mission - We are passionately committed to serving our respected Kenyan farmers in adding value to their farming at every level by offering the highest quality products at affordable pricing and ensuring the ultimate production that meets their expectations. Our five year goal is to ensure every farmer has knowledge of crop protection that adds value and contributes not only to food security but impacts significantly on their economic power.

✶ Our Jingle - Your Growth, Our Growth

✶ Our Values:
  ➢ Integrity
  ➢ Honesty
  ➢ Customer Satisfaction
  ➢ Unequalled Service
OUR LOCATION.

We are based in Nairobi, KENYA with a well established supply network across the country.
PEST CONTROL

Refers to the regulation or management of a species defined as a pest, and can be perceived to be detrimental to a person’s health, the ecology or the economy.
Mosquitoes are small, midge-like flies which comprise the family Culicidae. Females of most species are ectoparasites, whose tube-like mouthparts (called a proboscis) pierce the hosts’ skin to consume blood. When a Mosquito feeds on blood they must first inject their saliva into their host. When they move on to the next host, whatever diseases were in the Mosquito’s previous host are transmitted to the following one. While not every Mosquito bite is deadly, they can carry illnesses as serious as Malaria, Yellow Fever and the West Nile Virus.

COCKROACHES

Cockroaches are insects of the order Blattodea, sometimes called Blattaria, of which about 30 species out of 4,600 total are associated with human habitats. About four species are well known as pests. Among the best-known pest species are the American cockroach, Periplaneta americana, which is about 30 mm (1.2 in) long; the German cockroach, Blattella germanica, about 15 mm (0.59 in) long; the Asian cockroach, Blattella asahinai, also about 15 mm (0.59 in) in length; and the Oriental cockroach, Blatta orientalis, about 25 mm (0.98 in). If you spot one roach in your house, odds are that there are thousands more lurking. These pests feed on the food in your pantry and leave behind foul waste. It takes a roach extermination expert to truly rid your house of these resilient pests. Greenlife guarantees your family that our cockroach control service will rid your home of pests for good.

RATS & MICE

Rat and mouse that are by far the most prevalent and important pests in homes and businesses worldwide due to their ability to adapt to the human environment. All rodents have the common identifying feature of a pair of incisor teeth in the upper jaw. They tend to have short legs and a long tail, but a closer look at their body characteristics and habits shows that there are easily distinguishable features that you can use to identify which pest is invading your property.

**TERMITES**

Termites are one of the most destructive nuisances to your constructions, buildings, trees, plants and homes. They cause billions of dollars in damage around the world each year. Termites live in colonies of several hundred to several million, with the queens laying up to 2000 eggs per day. As non-stop eaters, termites consume a building/home from the inside out, with the damage frequently no evident until the structure is already ruined. For the best solution for preventing or treating termite damage to your building/home, our highly trained professionals will assess your home’s needs & recommend an effective and lasting termite control or treatment solution.
